The rapid increase in web usage has led to dramatically increased loads on the network infrastructure and on individual web servers. To ameliorate these mounting burdens, there has been much recent interest in web caching architectures and algorithms. Web caching reduces network load, server load, and the latency of responses. However, web caching has the disadvantage that the pages returned to clients by caches may be *stale*, in that they may not be consistent with the version currently o ...

A parsing program for context-free grammars based on an algorithm due to Martin Kay

has been combined with a phrase-structure grammar preprocessor. The result is an efficient context-free parsing package. Implementation is in FORTRAN G under MTS. The paper contains first a user's guide to the programs. Then the parsing strategy as well as the functions of the major subroutines are described.

The lack of an appropriate external data model is one of the reasons for the dearth of effective network management applications. Many network management computations over Management Information Bases (MIBs) cannot be practically accomplished through remote interactions. This paper describes the design of an mib Computations System that supports the dynamic definition of external data models for mibs. The system consists of a View Definition Language (VDL) to specify mib external views and SNMP- ...

As computer networks expand, there is a pressing need for management systems capable of handling errors. This article proposes an approach based on management proxies to improve the dependability of fault management systems. An effective MIB to implement the proxies is presented, which allows their deployment at virtually no cost. As an

example, a case study of a WAN is carried out. © 1998 John Wiley & Sons, Ltd.

Large internet environments are increasing the difficulty of network management. Integrating increasing numbers of autonomous subnetworks (each with an increasing number of hosts) makes it more difficult to determine if the network managers of the subnetworks will interoperate correctly. We propose a high level, formal specification language, NMSL, as an aid in solving this problem. NMSL has two aspects of operation, a

descriptive aspect and a prescriptive aspect. In its descriptive aspect, ...

Managing the communications resources of a computer network is critical to the successful operation of the network. A network management system is expected to manage a large collection of network nodes remotely. There is an obvious need for sophisticated network management application software in this process. Previous network management systems have been designed without particular regard for the application programmer's interface requirements. We propose that such software be written in a ...

Deployment of multicast routing services in corporate networks and Internet Service Providers is still tentative. Among other problems, there is a lack of monitoring and management tools and systems. Previous work in multicast management has failed to address the scalability problem present in multicast fault isolation and reporting. We propose a hierarchical, passive monitoring scheme, HPMM, that relies on a series of pre-deployed, self-organized monitoring daemons. With HPMM, fault message ...

This paper presents the notion of problem-oriented object memory, and its realization in a distributed object-based programming system, *Penumbra*. This system allows location transparent object invocation, object migration and caching. Its distinguishing feature, however, is its support for problem-oriented object sharing. Problem-oriented object memory is an object model that allows exploitation of application specific semantics by relaxing strict consistency in favour of performance. Our w ...

Active networks allow their users to inject customized programs into the nodes of the network. An extreme case, in which we are most interested, replaces packets with "capsules" - program fragments that are executed at each network router/switch they traverse. Active architectures permit a massive increase in the sophistication of the computation that is performed within the network. They will enable new applications, especially those based on application-specific multicast, information fusion, a ...

An emerging tapestry of computations will soon integrate systems around the globe. It will evolve without central control. Its complexity will be vast. We need new ideas, tools and methods to help map, understand and manage this tapestry. We contribute a light-weight architectural aspect that designers can use without compromising their own architectural preferences. Widespread use could help. The idea is for objects to provide web-based interfaces to object-specific meta-data, stat ...
